Development of an Injury Risk Curve for Child Pedestrians in the U.S.
Samantha H. Haus, and Hampton C. Gabler
Virginia Tech - Wake Forest Center for Injury Biomechanics

Background

• In 2017, 214 children under the age of 15 were fatally struck in vehicle-pedestrian collisions.
• Children interact with vehicles differently than adults due to their smaller stature and differing biomechanics [1].

Data Sources

1. Pedestrian Crash Data Study (PCDS)
   → Collected by NHTSA from 1994-1998
   → Contains detailed injury information (AIS-90) and impact speeds
   → Children defined as less than 15 years old (n = 92)
   → 23 had an MAIS 3+F injury
   → 47 had MAIS 2+F injury
2. General Estimates System (GES)
   → used to weight PCDS data by injury prevalence

Methods

Fit data with a logistic model:

\[
P_{\text{MAIS3+F}}(v, \text{height}) = \frac{1}{1 + \exp\left(-A_{\text{MAIS3+F}} - B_{\text{MAIS3+F}} \cdot v - C_{\text{MAIS3+F}} \cdot \text{height}\right)}
\]

\[
P_{\text{MAIS2+F}}(v, \text{height}) = \frac{1}{1 + \exp\left(-A_{\text{MAIS2+F}} - B_{\text{MAIS2+F}} \cdot v - C_{\text{MAIS2+F}} \cdot \text{height}\right)}
\]

Results

Adult

Child

Conclusions

This study was limited by the small sample size and age of the dataset. Vehicle geometry may play a role in injury severity, but that analysis could not be done with the limited sample size. PCDS was collected in the 1990s which means that the vehicles in the study are different than the vehicles on the road today. Due to the height difference of children, injuries to specific body regions, like the head, may be more common. In the future, we would like to create risk curves by body region and incorporate vehicle design in the model.

Despite these limitations, these curves provide an early look at child injury risk in vehicle-pedestrian collisions and may help inform pedestrian cognizant vehicle design and regulatory tests parameters.

Acknowledgements

The authors would like to acknowledge the Toyota Collaborative Safety Research Center (CSRC) and Toyota Motor Corporation for funding this study. Our special thanks to Rini Sherony of Toyota for sharing her technical insights and expertise throughout the project.
